

# How do Organisms Reproduce? (Set B) — MCQ Worksheet

Science • Chapter 7 • 25 Questions, 1 mark each — Total: 25 marks

**Instructions:** Choose the correct option (A / B / C / D) for each question. Each question carries 1 mark. There is no negative marking. Suggested time: 30 minutes.

**Q1.** DNA copying is essential because:

- (A) It carries information from parent to offspring
- (B) It increases body size
- (C) It produces energy
- (D) It changes diet

**Q2.** Variations are important for:

- (A) Survival in changing environment
- (B) Increasing size
- (C) Fixed traits
- (D) Maintaining identical population

**Q3.** Amoeba reproduces by:

- (A) Binary fission
- (B) Multiple fission
- (C) Budding
- (D) Spore formation

**Q4.** Plasmodium reproduces by:

- (A) Multiple fission
- (B) Binary fission
- (C) Budding
- (D) Fragmentation

**Q5.** Yeast reproduces by:

- (A) Budding
- (B) Binary fission
- (C) Spores
- (D) Fragmentation

**Q6.** Hydra reproduces by:

- (A) Budding
- (B) Spores
- (C) Binary fission
- (D) Roots

**Q7.** Spirogyra reproduces by:

- (A) Fragmentation
- (B) Budding
- (C) Spores
- (D) Multiple fission

**Q8.** Bryophyllum can reproduce vegetatively through:

- (A) Leaf notches (adventitious buds)
- (B) Seeds only
- (C) Spores
- (D) Pollen

**Q9.** Potato is propagated through:

- (A) Eyes (buds on stem tuber)
- (B) Roots
- (C) Leaves
- (D) Seeds

**Q10.** Tissue culture produces plants:

- (A) Identical to parent (clones) in large numbers
- (B) Different from parent
- (C) Without DNA
- (D) Only flowers

**Q11.** Pollination is transfer of:

- (A) Pollen from anther to stigma
- (B) Egg from ovary to ovule
- (C) Stigma to anther
- (D) Seed to soil

**Q12.** Female reproductive part of flower includes:

- (A) Stigma, style, ovary
- (B) Anther, filament
- (C) Sepal, petal
- (D) Pedicel

**Q13.** After fertilisation, ovary develops into:

- (A) Fruit
- (B) Seed
- (C) Pollen
- (D) Flower

**Q14.** Sperms are produced in:

- (A) Testes
- (B) Liver
- (C) Kidney
- (D) Heart

**Q15.** Fertilisation in humans occurs in:

- (A) Fallopian tube
- (C) Vagina

- (B) Uterus
- (D) Ovary

**Q16.** Menstruation occurs because:

- (A) Egg not fertilised; uterus lining sheds
- (C) Uterus contracts

- (B) Egg fertilised
- (D) Hormones stop

**Q17.** Placenta provides:

- (A) Oxygen, nutrients and removes wastes for fetus
- (C) Only food

- (B) Only oxygen
- (D) Nothing

**Q18.** Vasectomy is:

- (A) Cutting/tying vas deferens (male sterilisation)
- (C) Cutting fallopian tube

- (B) Removing ovary
- (D) Removing uterus

**Q19.** Tubectomy is:

- (A) Cutting/tying fallopian tubes (female sterilisation)
- (C) Removing ovaries

- (B) Removing uterus
- (D) Removing kidney

**Q20.** Why are sexually transmitted infections of concern?

- (A) They spread via unprotected sex and can be serious (e.g. AIDS, syphilis)
- (C) They are easily cured always

- (B) They only affect plants
- (D) They are imaginary

**Q21.** Copper-T:

- (A) Is intra-uterine contraceptive device
- (C) Is hormonal pill

- (B) Is surgical sterilisation
- (D) Is barrier method

**Q22.** Why does asexual reproduction produce genetic similarity in offspring?

- (A) No mixing of gametes; offspring inherit identical DNA from one parent
- (C) Mixing of DNA

- (B) Random mutation
- (D) Many parents

**Q23.** In Rhizopus, spores germinate to form:

- (A) New hyphae and a new fungus
- (C) Bacteria

- (B) Algae
- (D) Soil

**Q24.** Regeneration in Planaria is possible because:

- (A) Specialised cells reorganise into a whole organism
- (C) It has spine

- (B) It has many hearts
- (D) Cells multiply only

**Q25.** Why is sexual reproduction generally preferred over asexual reproduction for species survival?

- (A) It produces variations that aid adaptation
- (C) It needs no energy

- (B) It is faster
- (D) It is cheaper
